Product Data Sheet

Mounting pad for Keystones jacks with a cable stripping tool

Part Number: LAN-OK-FIX

Mounting pad for Keystones jacks with a cable stripping tool

Description

The mounting pad is designed to ease the process of termination twisted pair cable on Keystone type telecommunication jacks. It is compatible with all types of LANMASTER and TWT jacks including shielded ones (STP). The pad can also be used for termination of Keystone jacks of other manufacturers.

The pad allows installation of both 90-degree and 180-degree IDC contacts. For the installer's convenience the pad includes templates for determining insulation

stripping lengths, degree of pairing, and conductor layouts.

The use of the mounting pad significantly reduces the risk of damage to the hands and surrounding surfaces when the punch down tool slips. The shape of the pad allows you to mount the jacks on the palm of your hand when there is no possibility of using another surface.

The mounting pad comes with a tool for stripping and punching cable on Keystone jacks and patch panels. The tool is designed to eliminate the possibility of accidental cuts. The pad has a special storage area for the tool.
